ANCHORS – CHAINS- IMPACTS

One of the main threats to *Posidonia oceanica* meadows is **anchoring** by recreational boats. The problem is made worse by the lack of accurate and accessible maps showing where seagrass is located.

Mediterranean Posidonia Network

60%
of meadows are
outside MPAs

Countless
**ecosystem
services**

34%
of Posidonia coverage
has been lost these
past 50 years due to
multiple pressures

2M hectares
of meadows in the
Mediterranean

25%
of Mediterranean
marine species
rely on it

~€50,000
per ha per year
of economic value

**Develop
financing
mechanisms**

by 2030 to finance priority
action sites

**Develop low-
impact moorings
by 2030:**

1,000 moorings for small
and large yachts in priority
action sites

**Support the
implementation of
European regulations**

prohibiting large ships from anchoring
in meadows, in particular on the north-
western shore of the Mediterranean

**Complete the
mapping of
Posidonia**

and in the southern shore
countries

**Stakeholder
engagement
and raising awareness**

so that meadows are recognised
on the same level as coral reefs
and mangroves

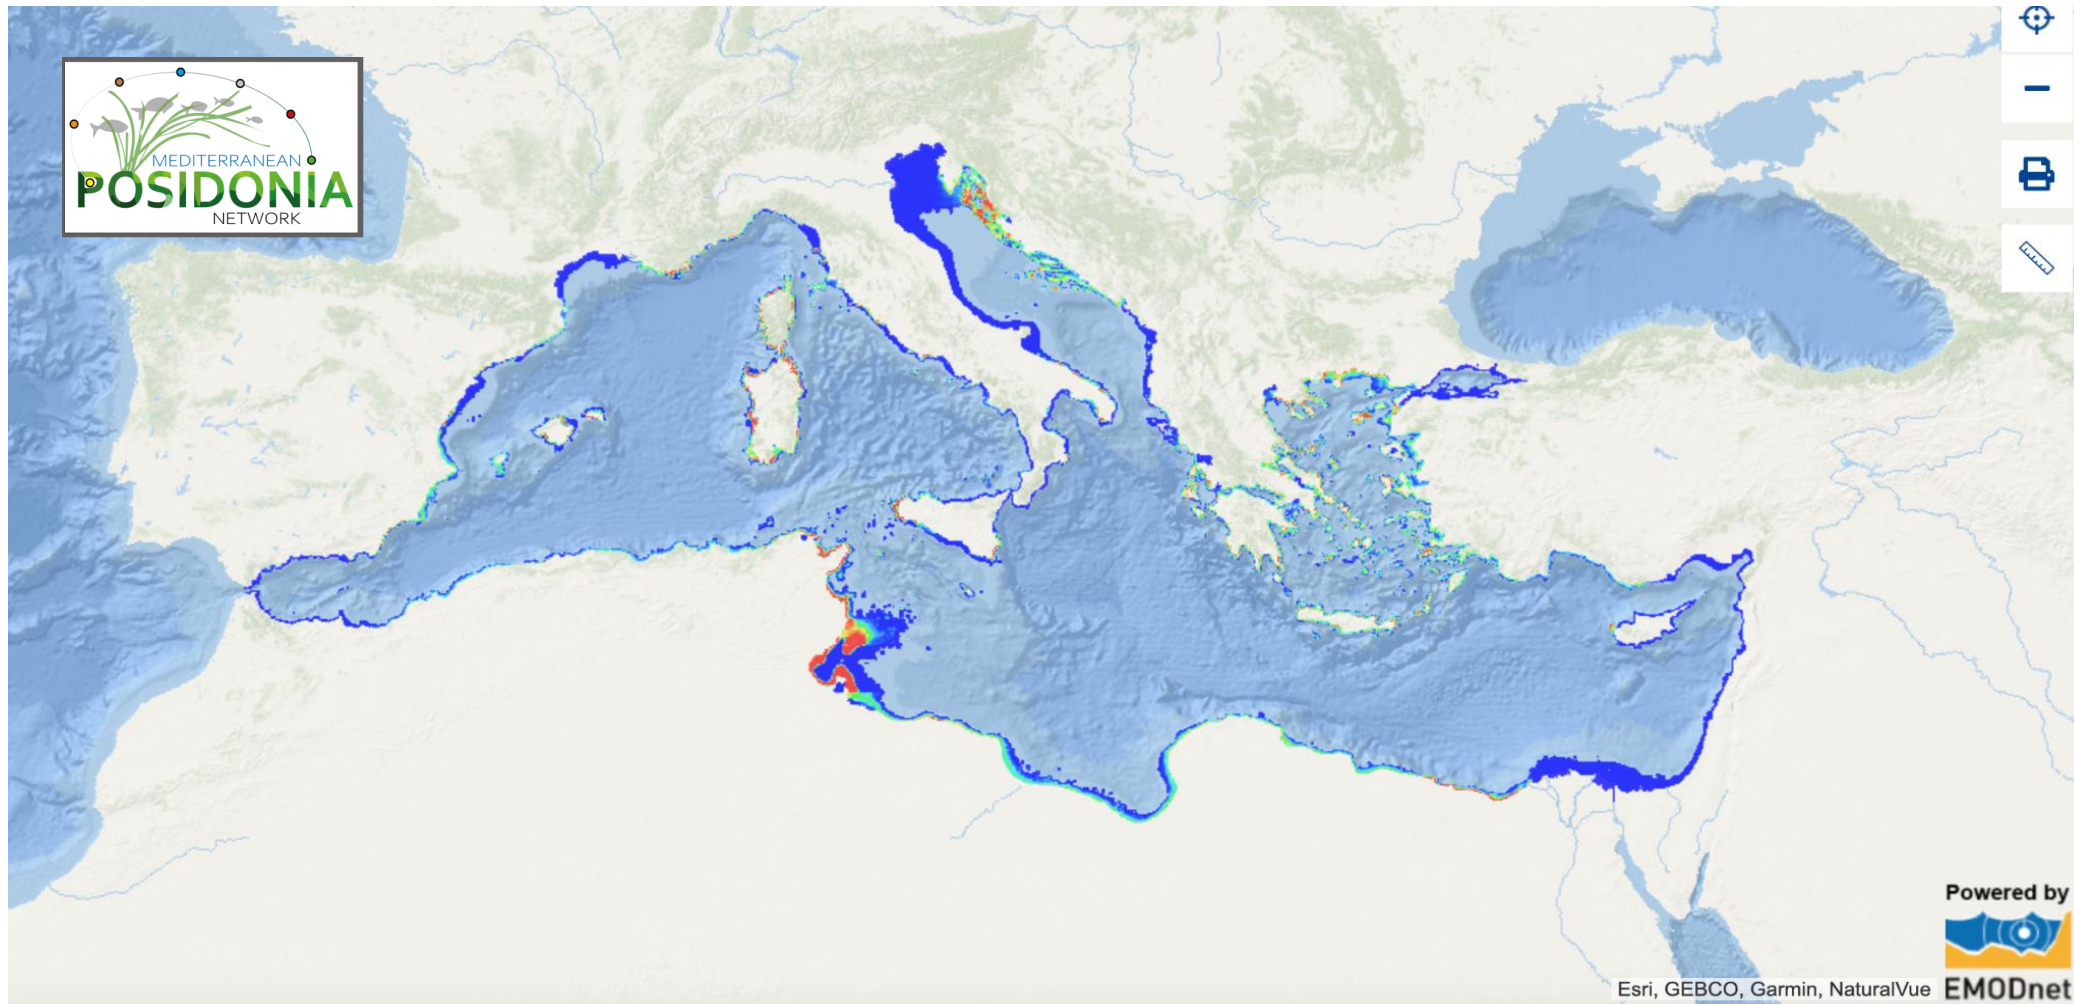

**Identify and
map the main
pressures**

threatening Posidonia all across the
Med including pollution, anchoring,
fishing activities and urbanisation

RESOLUTION

Drone, Mavic E3M, 3cm pixel size

Commercial Satellite, MAXAR WVIII, 1.2m pixel size

Commercial Satellite, PlanetLabs, 3m pixel size

Copernicus Sentinel 2, 10m pixel size

Island of Crete, Greece, location = 35°24'29.2"N 25°01'17.4"E

WEBINAR Satellite-Based Posidonia Mapping

19-March-2025

Satellite state of art solutions to map *Posidonia oceanica* and pressures

Highest mapping accuracy in shallow, transparent waters (0–20m). 99% -85%

Accuracy decreases with depth and turbidity.

Still limited in detecting species with similar spectral signatures.

Ground-truth data and validation are essential to improve models.

Mapping in turbid or mixed-habitat areas remains a major challenge.

Accuracy of satellite-based mapping of *Posidonia oceanica* meadows
(in clear waters, using Sentinel-2 and high-resolution imagery)

Depth Range (m)	Estimated Accuracy (%)
0–10	99%
10–20	85%
20–30	65%
30–40	43%

SATELLITES → ANCHORING, TRAWLING, INVASIVE SPECIES

DRONES / LIDAR

→ FINE-SCALE MAPS IN SHALLOW OR TURBID AREAS

AIS + MACHINE LEARNING

→ VESSEL DETECTION AND PRESSURE ANALYSIS

MOBILE APPS + GPS

→ HUMAN ACTIVITY MAPPING ON COASTLINES

IN SITU SENSORS

→ WATER QUALITY AND POLLUTION INDICATORS
